

# The thepdfnumber package

Heiko Oberdiek\*

2016/05/16 v1.1

## Abstract

The package converts real numbers to a minimal representation that is stripped from leading or trailing zeros, plus signs and decimal point if not necessary.

# 1 Documentation

## 1.1 Introduction

Dealing with the PDF format, there is sometimes the need to write some low level PDF stuff. In case of numbers, the numbers can arise from user input (e.g. color or transparency specifications) or can be calculated. For example, L<sup>A</sup>T<sub>E</sub>X's `\strip@pt` makes a good job to output a real number. It automatically suppresses the decimal part if the number is an integer. However it leaves a leading zero for numbers greater zero and smaller one. Thus the package provides macros that can be used with different formats, even with iniT<sub>E</sub>X and generates numbers that are valid numbers of the PDF format and whose length is minimal.

## 1.2 Usage

The package `thepdfnumber` can be used with L<sup>A</sup>T<sub>E</sub>X, plain T<sub>E</sub>X or even with iniT<sub>E</sub>X:

```
\RequirePackage{thepdfnumber} % LATEX
\input thepdfnumber.sty % plain TEX/iniTEX
```

The package does not need and have package options.

## 1.3 User macros

All user macros are expandable in exact two expansion steps.

<code>\thepdfnumber {&lt;number&gt;}</code>
---

Macro `\thepdfnumber` takes a number as argument and expands to a minimal representation of that number. Some examples:

1.: +123	→ 123
2.: --123	→ 123
3.: -01	→ -1
4.: 0045	→ 45
5.: 1.0	→ 1
6.: 1.20	→ 1.2
7.: 0.0	→ 0
8.: 0.78	→ .78
9.: +012.340	→ 12.34

It reduces the length of the number representation:

- The signs are collapsed and only one minus sign is output if the number is negative (see examples 1, 2, 3, 9).
- Leading zeros are removed (4, 8, 9) unless the number is zero (7).
- The decimal part is omitted, if the number is an integer (5, 7).
- Trailing zeros from the decimal part are stripped (5, 6, 7, 9).

The resulting number representation can be caught with one of the following Perl regular expressions:

- `^0$` (zero)
- `^-?[1-9][0-9]*$` (integer)
- `^-?[0-9]*\.[0-9]*[1-9]$` (real)

This is a valid numeric object of the PDF specification [1, “7.3.3 Numeric Objects”].

`\thepdfnumberNormZeroOne`

There are various places in the PDF specification where the number is in the domain 0.0 upto 1.0. Macro `thepdfnumberNormZeroOne` automatically adjusts the number to fit into that range. Negative numbers are mapped to 0 and numbers greater than one are replaced by 1. Thus the result fits one of the following regular expressions:

- $\text{~}0\$$
- $\text{~}\.[0-9]*[1-9]\$$
- $\text{~}1\$$

Examples:

```
-456    → 0
-0.001  → 0
0.0     → 0
0.010   → .01
0.456   → .456
1.0     → 1
01.001  → 1
4       → 1
```

## 1.4 Input number

The user macros expect a number as argument. The number can either be given explicitly or as macro that expands in one step to an explicit number, because the first token of the argument is expanded once.

The explicit number consists of

- optional signs ‘+’ and ‘-’,
- digits ‘0’ upto ‘9’ and
- an optional dot ‘.’.

All tokens must have catcode 12 (other), the default catcodes for these characters in  $\text{\LaTeX}$ , plain  $\text{\TeX}$  or  $\text{iniTeX}$ . As Perl regular expression the number is expected in one of the following forms:

- $\text{~}[+-]*[0-9]+\$$
- $\text{~}[+-]*[0-9]*\.[0-9]*\$$

At least one digit or the dot must be present.

## 1.5 Error handling

The package is not intended for validating numbers or to decide if an argument is a number. Therefore it is an usage error to use the user macros with arguments that are not explicit numbers as specified in the previous sections. Nevertheless some error conditions are sometimes recognized. Errors are given in form of an undefined command sequence. It is the only way to notify  $\text{\TeX}$  in expandable context. Expanding to some error text would invalidate the output. Currently the following errors are thrown:

`\thepdfnumber@ErrorEndMarker`: Internally the argument parsing uses an end marker that is never called directly. If it is called with valid user input, then this is a bug. Otherwise it means the user input contains nasty stuff.

`\thepdfnumber@ErrorUnexpectedEnd`: The macros expect at least one digit or the dot, otherwise if the argument is empty or only contains signs, then this error is called.

`\thepdfnumber@ErrorInvalidToken`: It is called if the number contains other tokens than signs, digits or the dot or the token at the wrong place (e.g. a sign after a digit). In case of `\thepdfnumberNormZeroOne` this error condition might not always be detected, because the number parsing might stop at an early point, when the result is already clear (e.g. if the number is negative or will be greater than one).

**Improper alphabetic constant**: This error might be thrown by `TEX`, if the number contains command tokens instead of characters.

## 2 Implementation

```
1 (*package)
```

### 2.1 Reload check and package identification

Reload check, especially if the package is not used with `LATEX`.

```
2 \begingroup\catcode61\catcode48\catcode32=10\relax%
3 \catcode13=5 % ^M
4 \endlinechar=13 %

## 3 Installation

### 3.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

[CTAN:macros/latex/contrib/oberdiek/thepdfnumber.dtx](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek/thepdfnumber.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/thepdfnumber.pdf](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek/thepdfnumber.pdf) Documentation.

**Bundle.** All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](https://ctan.org/ctan/packages/install/macros/latex/contrib/oberdiek.tds.zip)

*TDS* refers to the standard “A Directory Structure for  $\TeX$  Files” ([CTAN:pkg/tds](https://ctan.org/ctan/packages/pkg/tds)). Directories with `texmf` in their name are usually organized this way.

---

<sup>1</sup>[CTAN:pkg/thepdfnumber](https://ctan.org/ctan/packages/pkg/thepdfnumber)

## 3.2 Bundle installation

**Unpacking.** Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

## 3.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain `TEX`:

```
tex thepdfnumber.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
thepdfnumber.sty → tex/generic/oberdiek/thepdfnumber.sty
thepdfnumber.pdf → doc/latex/oberdiek/thepdfnumber.pdf
thepdfnumber.dtx → source/latex/oberdiek/thepdfnumber.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

## 3.4 Refresh file name databases

If your `TEX` distribution (`TEX Live`, `MiKTEX`, ...) relies on file name databases, you must refresh these. For example, `TEX Live` users run `texhash` or `mktexlsr`.

## 3.5 Some details for the interested

**Unpacking with  $\LaTeX$ .** The `.dtx` chooses its action depending on the format:

**plain `TEX`:** Run `docstrip` and extract the files.

**$\LaTeX$ :** Generate the documentation.

If you insist on using  $\LaTeX$  for `docstrip` (really, `docstrip` does not need  $\LaTeX$ ), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{thepdfnumber.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with `pdf $\LaTeX$` :

```
pdflatex thepdfnumber.dtx
makeindex -s gind.ist thepdfnumber.idx
pdflatex thepdfnumber.dtx
makeindex -s gind.ist thepdfnumber.idx
pdflatex thepdfnumber.dtx
```
